

Interactive Display Solution

Touch Screen, Multimedia, and Scalable.

- ☆ Full screen touch display gives the customer or end user a new way learn about products and services. It will also enhance the buying experience with Multimedia integration and virtualization that provides much more detailed information than a static in-store or window display.
- ☆ The multimedia experience and interaction with the display unit provides the customer access to images and video's. Customers who may pass over a product or service based on a static display will be more engaged and interested in the product.
- ☆ Display units are very easy to scale. From the 30" to 100" base display, to multiple units that can be controlled via a console located in the center of a virtual room.

CORE's Interactive Display Solution is a great way to show products and services to a potential customer that will engage them more than ever before. Leaving an impression that can give businesses an edge on their competition. The display also improves the sales potential with customers making a decision more quickly than traditional static displays because it expands the information the customer can gain about the products or services.

When in idle mode, the display screen is always changing its message and drawing attention to it. When being utilized, the multimedia experience with video, images, and sound capture an even larger audience of viewers.

Display systems can be customized in size and expanded to multiple units that work in sync for full virtualization. The application content for the display itself is also customizable and can be provided by CORE. Allowing businesses to focus on what they do best and "Working Smarter, Not Harder!"
