

# Network

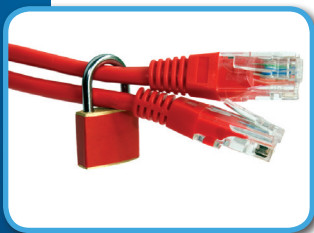

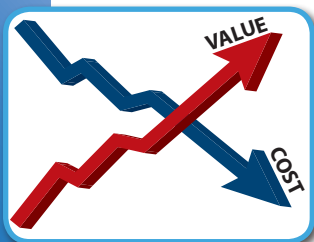

## Cost Effective, Stable, & Secure.

- ☆ Startup and maintenance costs are significantly reduced because no equipment purchase is required, there is a low monthly service charge, and costs to move, add, change, and update the system generally does not require an on-site visit.
- ☆ CORE realizes the importance and cost of any network downtime and implements production grade systems that will maintain a high level of quality and durability. CORE uses a production method that is well-documented and changes are controlled.
- ☆ CORE offers privacy and a peace of mind with solutions that secure the network and computer systems. CMS can also be designed to meet or exceed industry compliance standards.

CORE Managed Services (CMS) provides a cost effective, stable, and secure network environment capable of delivering advanced services such as voice and video. CMS does not require the purchase of any equipment, is turn-key, and scalable. CORE owns and maintains the equipment from end to end so it is worry free and simple.

Security of a client's network is priority. With CMS, our clients can utilize internet firewall technology along with Secure Virtual Private Networking (VPN) at or from their office. Secure Wireless LAN service is implemented for clients who need mobility within the facility and do not want unauthorized individuals accessing the network.

## Benefits

CMS will protect the network from outside intrusion and can restrict employees' access to only what they need using proper access control. Remote Access Control is utilized to permit remote employees to access the network through a secure VPN. With CMS, CORE maintains the functionality and security updates to maximize the protection of the network.

The production method that CMS utilizes to manage a network environment provides stability, security, and flexibility. CMS uses well documented procedures and business processes to create and maintain a production environment. CMS updates are reviewed quarterly so the client doesn't get locked into aging technology during a contract and changes to the network systems are scheduled. Maintenance is completed in off-hour windows to reduce any impact on productivity. CORE also tests all changes in a development environment so potential problems are resolved prior to implementation.

## Service Categories

- ★ **Local Area Networking (LAN)** – This basic service provides a network port for each network device. CORE secures the network to keep unauthorized individuals from accessing any systems.
- ★ **Secure Wireless Networking (WLAN)** – Organizations who utilize mobile devices such as laptops and telephones will need secure access without wires. Secure access is available using the latest in WLAN technologies.
- ★ **Internet Security** – Firewalls are implemented to increase protection and minimize the risk of downtime and potential for corruption of data. This service provides protection to computers and network devices from harmful and destructive content.
- ★ **Secure Remote Access** – This service provides remote offices and traveling personnel access to the data on the corporate network. Virtual Private Networking (VPN) provides remote connectivity using a secure internet connection.
- ★ **Wide Area Networking (WAN)** – WAN services are for organizations who want the highest level of security by utilizing a dedicated connection between multiple locations.

**"Technology made smarter, not harder"**

## CORE Products

- ★ CORE Managed Services
- ★ Computer Solutions
- ★ Networking Solutions
- ★ Telephone Solutions

CORE Technologies LLC offers a variety of solutions to meet our customers' needs. For small to medium sized companies, CORE can be your IT staff. For larger companies, CORE can augment the IT staff, so they can be as efficient as possible.
